Tanda Daftar Varietas: 283/PVHP/2014
Variety Registration: 283/PVHP/2014

The Maglia potato variety is derived from a cross done in 2005 between Atlantic variety as a female parent and clon # 3910585.175 as a male parent. The productivity of the Maglia variety is 29 ton/ha with water content of 79.6%. Besides it is higher in productivity compared to the Atlantic variety, it is also high in rendement of potato chip produced. This variety has low water contain and therefore required less palm oil to fry potato.

The Maglia variety has a specific gravity of 1.082-1.085 and has a higher dry matter as compared to Atlantic variety. This variety is good for use as potato chip product. It grows well in high elevation area. A production of Maglia variety seeds can minimize dependency from importing potato seeds and also provide opportunity for private to develop in country potato seed grower.
