Kedelai varietas DEVON 1 merupakan hasil persilangan tunggal antara varietas Kawi dengan galur IAC 100. Dapat dipanen pada umur ± 83 hari, agak tahan terhadap penyakit karat daun, dan agak tahan hama penghisap polong. Bobot biji yaitu $\pm 14,3$ gram per 100 biji, bentuk biji agak bulat dan warna kulit biji kuning.

Rata-rata hasil varietas DEVON 1 mencapai $\pm 2,75$ ton/ha dengan potensi hasil 3,09 ton/ha, kandungan protein 34,8%, dan kandungan lemak 17,34%. Tinggi tanaman $\pm 58,1$ cm dengan jumlah polong per tanaman ± 29 polong.

DEVON 1 soybean variety is derived from a single crosses between Kawi varieties with IAC 100 strains. Harvested at age ± 83 days, moderately resistant to leaf rust disease, and less resistant to pod borer. Grain weight of $\pm 14,3$ grams per 100 grains, slightly round-shaped and yellow seed skin color.

The average yield of DEVON 1 variety reaches ± 2.75 tons / ha with potential yield of 3.09 tons / ha, protein content is 34.8%, and fat content is 17.34%. Plant height is ± 58.1 cm with number of pods per plant is ± 29 pods.
